

Assignment 3 Discussion:

Starting this assignment I planned to use more of the functionalities of ejs and make better use of HTML pages. I kept up the use of storing relevant data in JS objects as this makes it easier to access and store it. This was my first experience in saving edited data semi-permanently, i.e. not just in RAM so it reverts at the end of server execution. My approach for this assignment was to write small modular functions to handle all the main functionality. I think this a good approach because it allowed for good use of express' design and made it simple to understand the control flow of the server. This was really good for teaching me how to make my code more modular with express and separate server code into different files based on routes. This is really good for the project as there are a lot of routes and cases to handle and being able to see related data in the same place will be very beneficial.
