Assignment3 Discussion:

My approach to this assignment was to try to implement my code from the last assignment into the server. This came with the same drawback however, of making the client side long and complex. It may have been easier to convert most of this to the ejs file. However, not having to refactor my code allowed me to focus more on learning how to write the server side efficiently. In relation to the project I think this assignment was very helpful in teaching me how client-server architecture works. This was my first experience coding my own server that served real data. And although we learned a much more efficient way of implementing this I think doing this first was a good way to understand what's going behind the scenes. This will help a great deal with how I continue to desighn my project.
